**ICOS Science Conference  
27-29 September 2016, Helsinki**

# Global Carbon Budget

$8.3 \pm 0.4 \text{ PgC/yr}$  99%

$1.0 \pm 0.5$

# The case for data assimilation

Large uncertainty from land to predict C-balance (GCP)

Le Quéré et al. 2013

## Available Observations

⇒ Carbon Cycle Data Assimilation System

= ecophysiological constraints from forward modelling

+ observational constraints from inverse modelling

# Previous results

- Water and Carbon Cycles tightly coupled
- Assimilation of FAPAR and atmospheric CO<sub>2</sub> constrains water fluxes

## Regional Evapotranspiration

Kaminski et al. (2012)

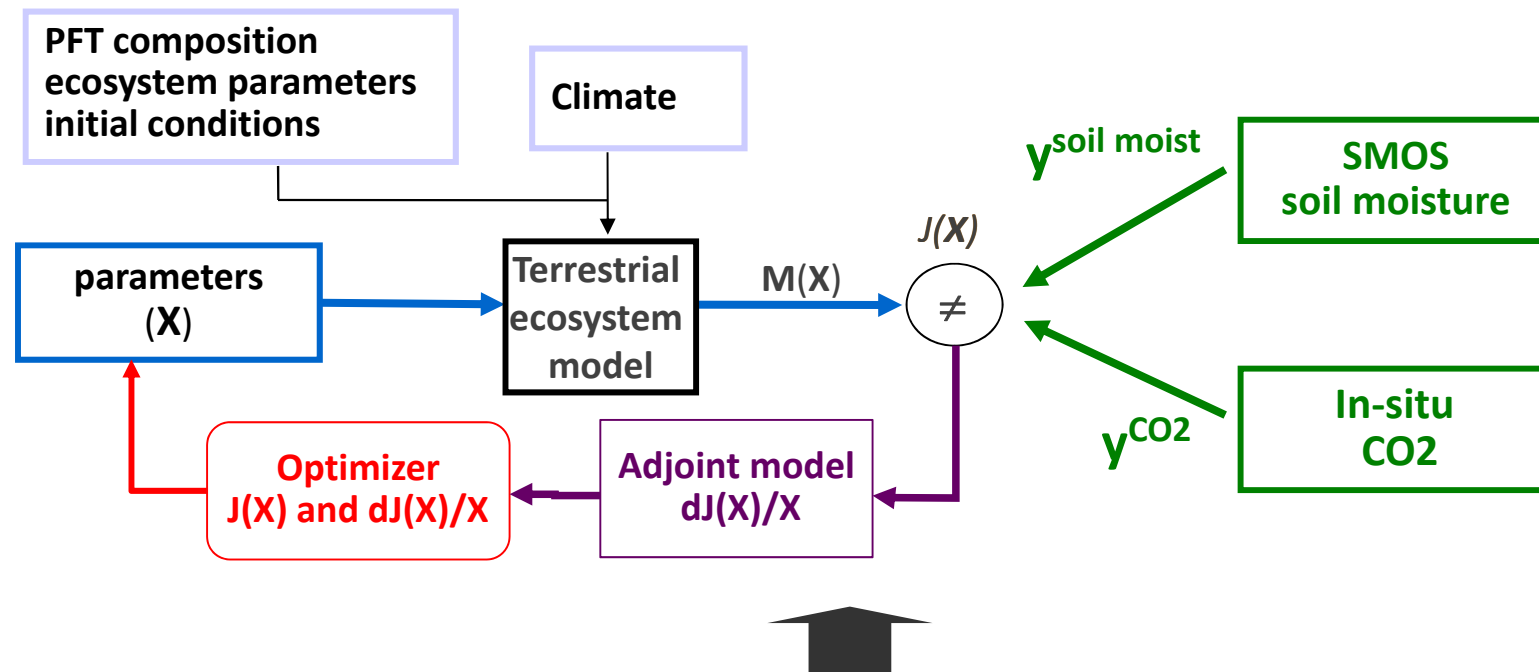

# Objective of this study

---

Assimilation of SMOS soil moisture observation together with atmospheric CO<sub>2</sub> concentration:

- To quantify the added value of remotely sensed soil moisture observations (as provided by SMOS) on constraining terrestrial C fluxes.
- To assess the potential of a SMOS-based NEE product.

# C-cycle data assimilation system

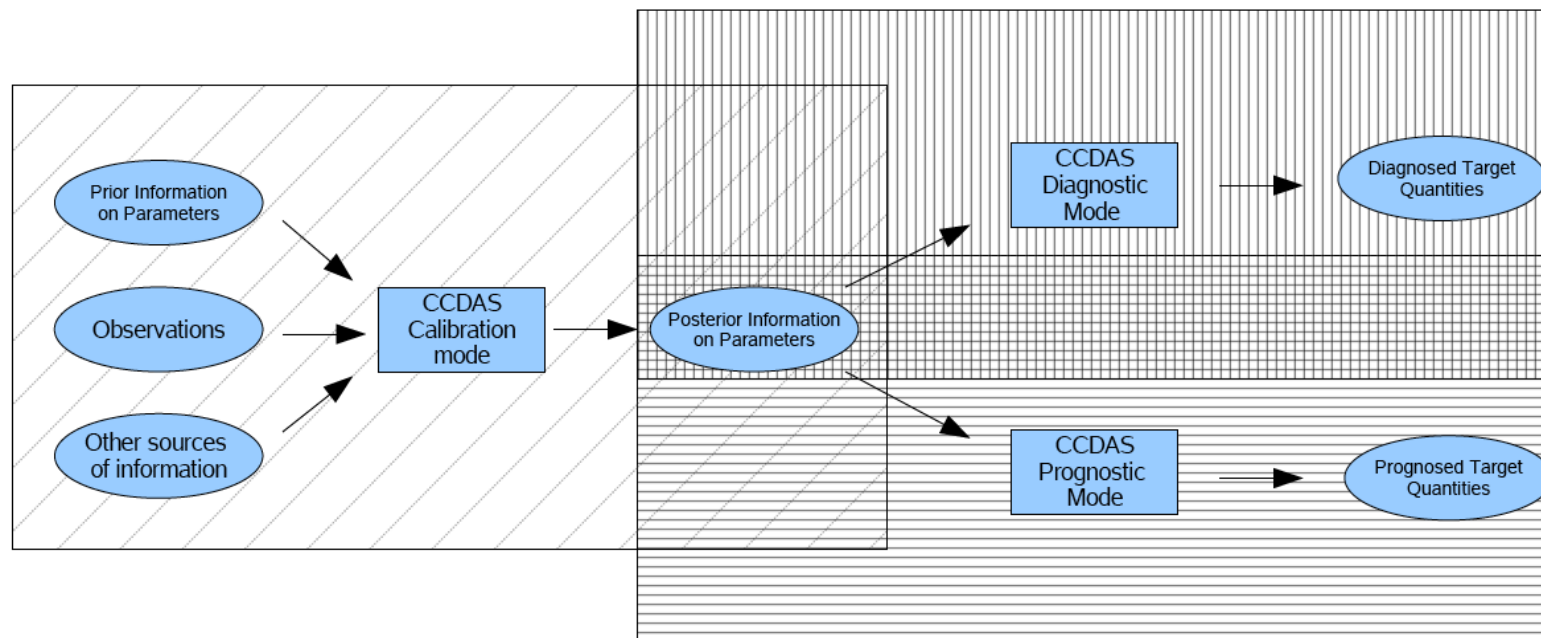

$$\text{Cost function: } J(x) = \frac{1}{2} \left[ \sum (y - M(x))^t C_y^{-1} (y - M(x)) + (x - x_p)^t C_p^{-1} (x - x_p) \right]$$

- Need to define the error matrices  $C_y^{-1}$ ,  $C_p^{-1}$

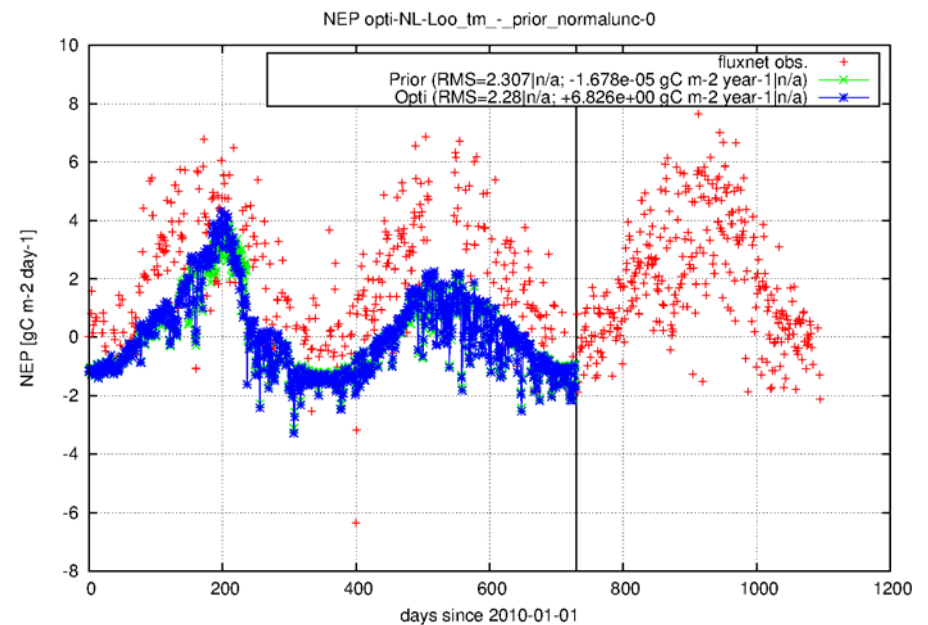

# CCDAS methodology

- Based on process-based terrestrial ecosystem model (BETHY)
- Optimizing parameter values ( $\sim 100$ ) based on gradient method
- Hessian ( $2^{\text{nd}}$  deriv.) to estimate posterior parameter uncertainty
- Error propagation by using linearised model

# Site-scale experiments

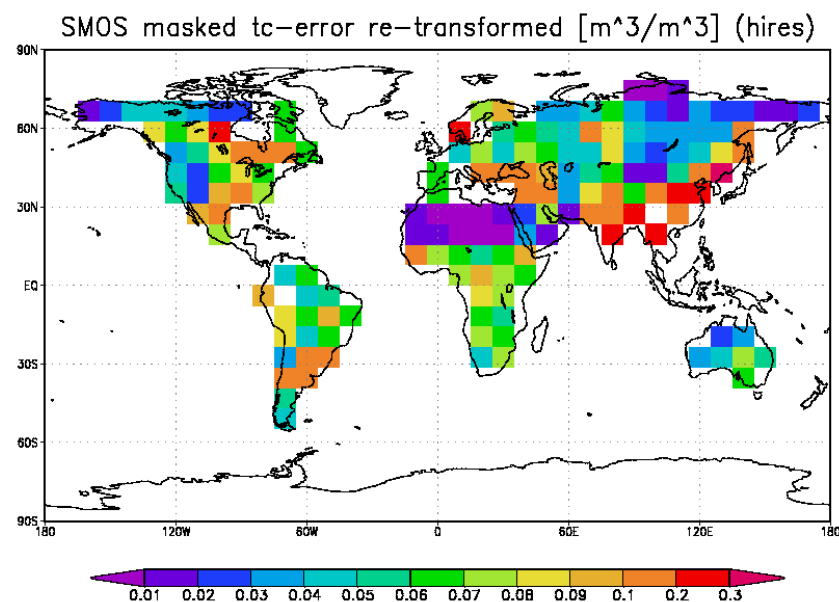

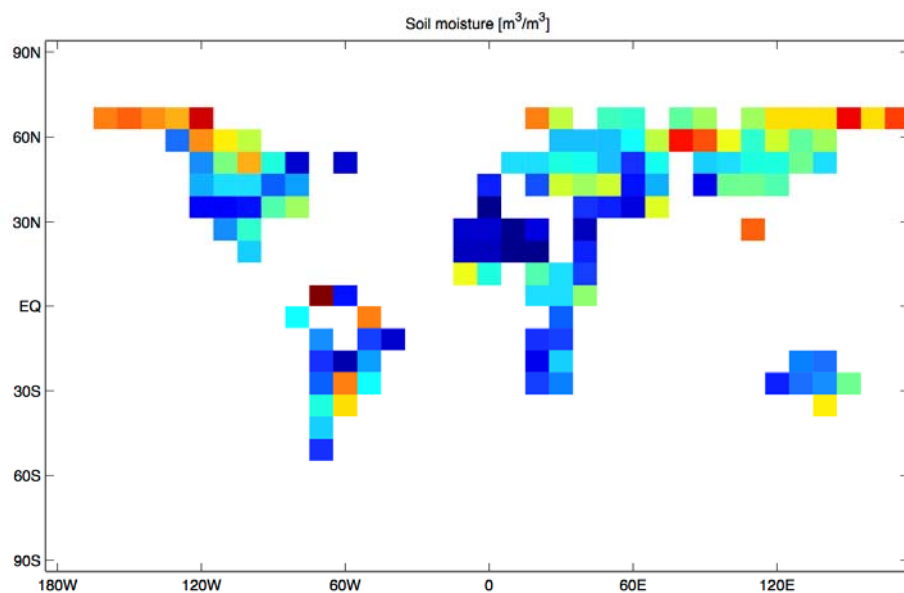

- Substantial model development to simulate surface soil moisture
- Joint assimilation of SMOS daily SM data for 5 sites
- 5 member ensembles from different starting points
- All 5 converge to same minimum

# Global Experiments

- Coarse resolution, 2 years (2010/11)
- Running 3-member ensembles from different starting points
- Baseline: in-situ atm. CO<sub>2</sub> (10 sites) concentrations only
- Baseline + SMOS daily soil moisture with variance/mean scaling

# Results: process-parameters

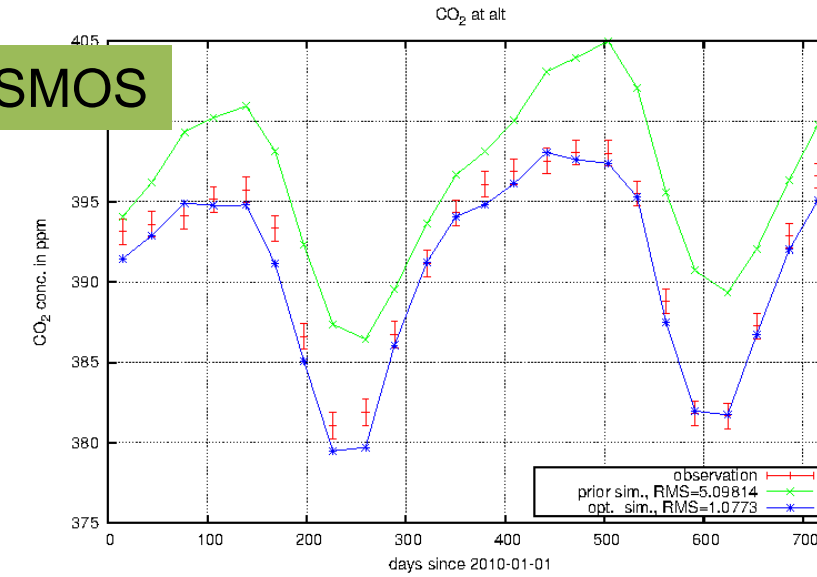

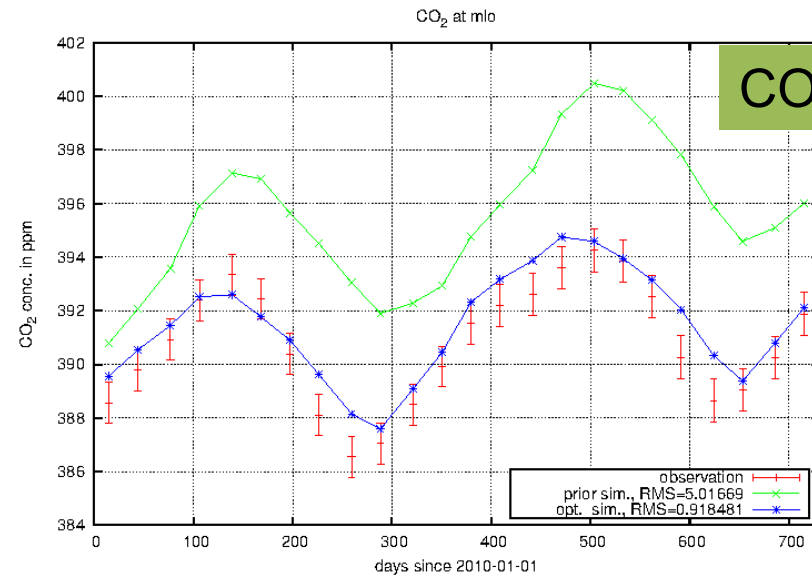

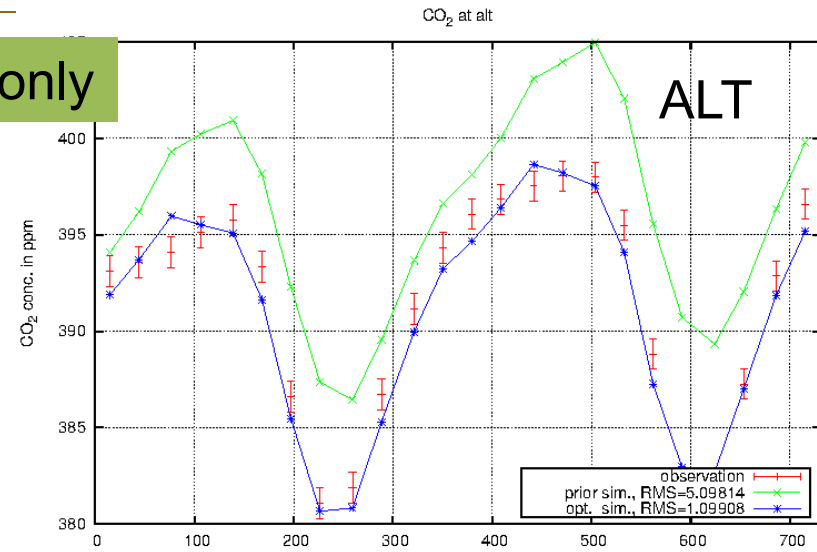

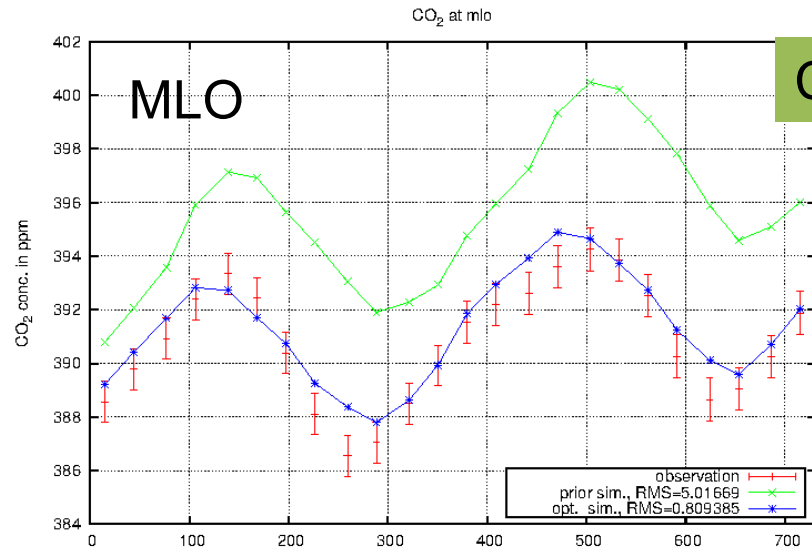

CO<sub>2</sub> only

CO<sub>2</sub> & SMOS

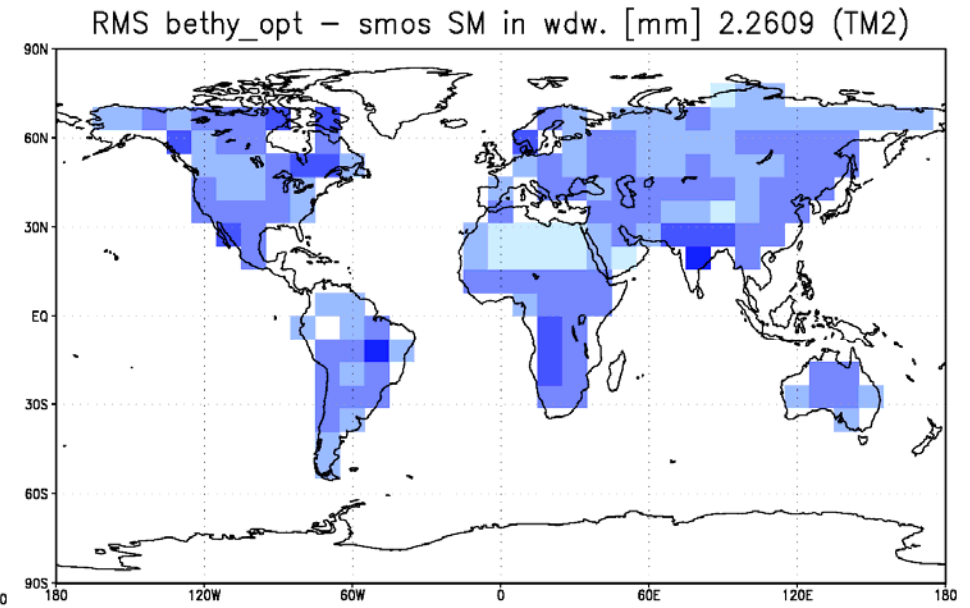

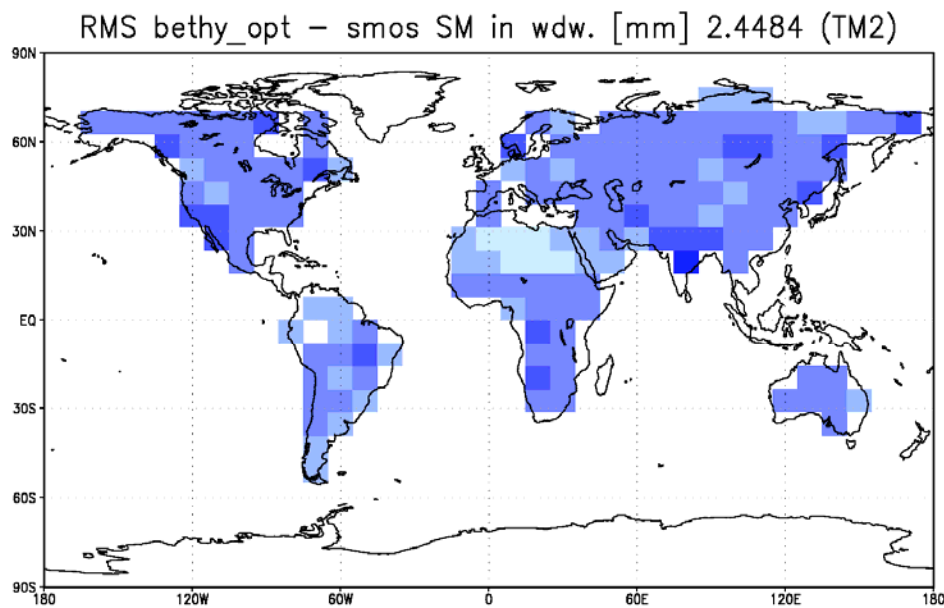

# Results: atm CO<sub>2</sub> (also for validation)

# Results: soil moisture (RMS)

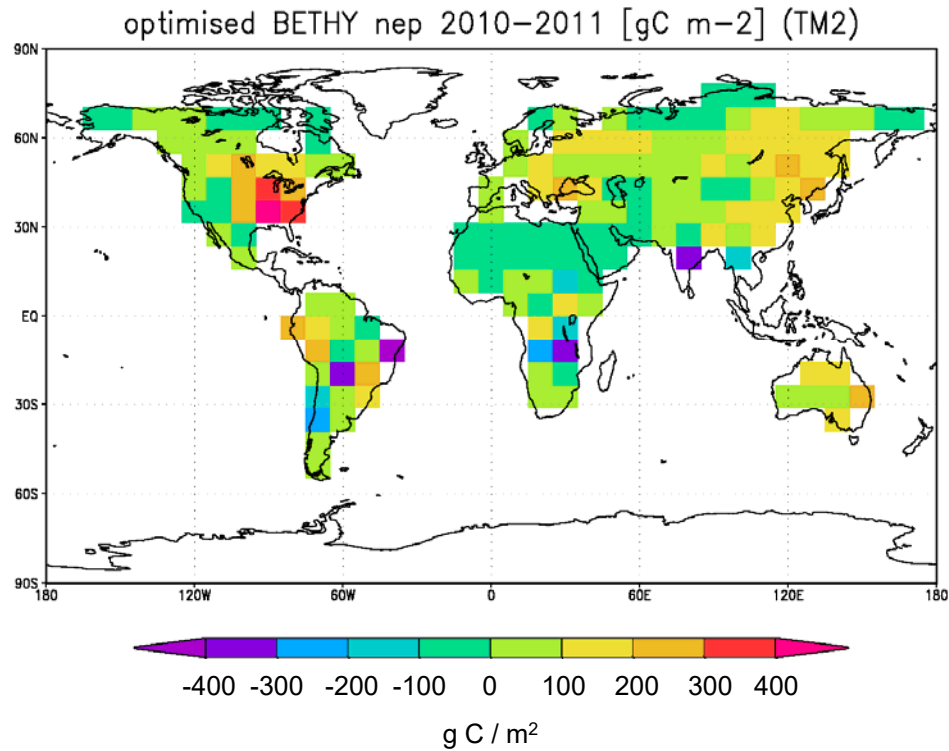

CO<sub>2</sub> only

CO<sub>2</sub> & SMOS

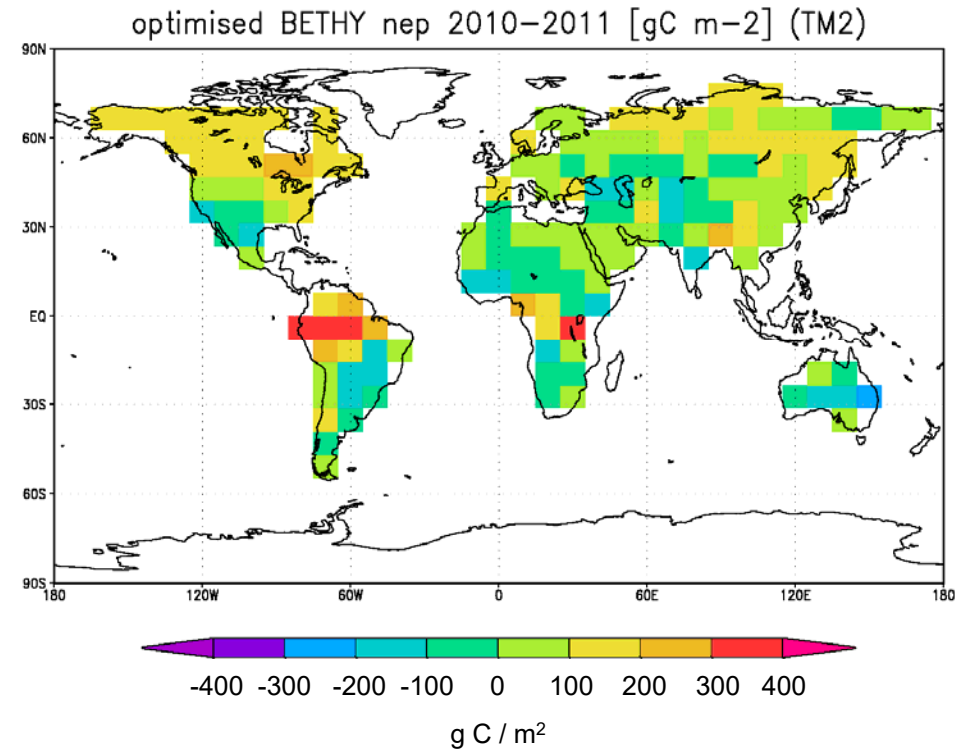

# Results: CO<sub>2</sub> fluxes (NEP)

CO<sub>2</sub> only

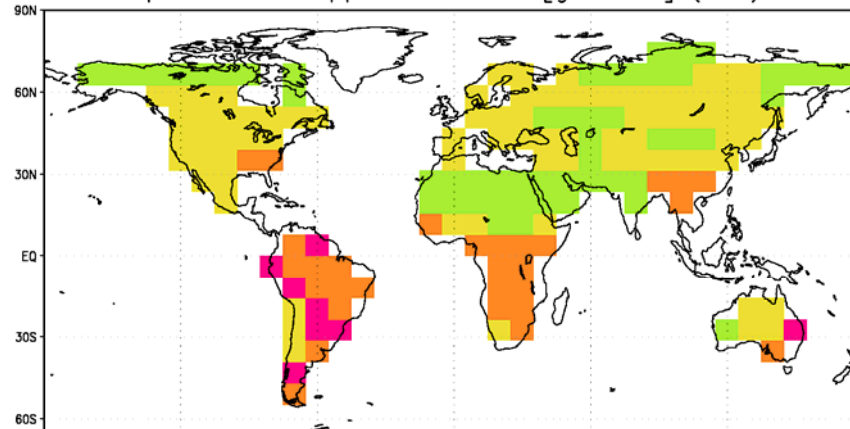

CO<sub>2</sub> & SMOS

# Results: CO<sub>2</sub> fluxes (NPP)

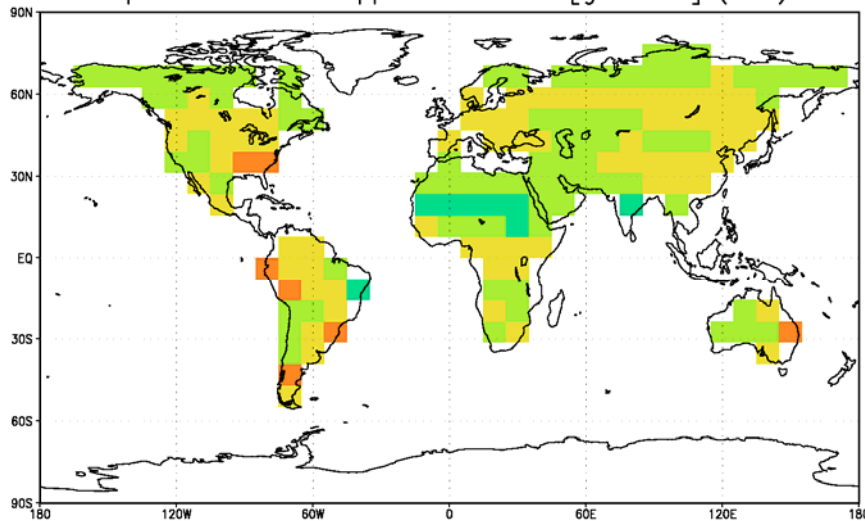

CO<sub>2</sub> only

# Validation: soil moisture at site level

CO<sub>2</sub> only

CO<sub>2</sub> & SMOS

# Relative flux (NEP & NPP) uncertainty reduction for 6 regions

# Conclusions

---

- CCDAS combines process understanding with observations, provides an integrated view on global carbon cycle and delivers elaborated products based on ICOS data (among others)
- Site scale experiments to test and validate assimilation system => demonstrates capabilities of CCDAS to assimilate SM
- First global experiments assimilating remotely sensed SM and atm. CO<sub>2</sub> simultaneously
- Significant added value (unc. reduction) compared to CO<sub>2</sub> only
- Further work using SMOS observations together with atm. CO<sub>2</sub>:
  - assimilate the full 6 years of SM data at high resolution
  - extend the assimilation system to additionally include microwave Vegetation Optical Depth data as a proxy for above ground biomass (vegetation water content) over various land-cover types
